Get Ready for Housing

Closamectin is the only pour-on product to combat liver fluke, as well as providing worming and ectoparasite cover with the ivermectin it contains. The anti-fluke drug is closantel and this will kill fluke aged 7 weeks or older. If you are concerned that your cattle are especially at risk, it can be worth treating 7 weeks after the animals are housed to so all of the fluke present get blitzed. To discuss fluke control in more depth, give us a ring and one of the vets can chat it through with you.

Trace Elements in Cattle

Late autumn and winter is often the time for ensuring cattle due to calve in the spring have the minerals and trace elements they need. Smartrace boluses have a variety of products, for both growing animals and adult cattle. There is the option of copper-free boluses giving us the opportunity to supplement without risk of excess copper in those herds that don't need it. The best way to assess the mineral status of your animals is through blood testing, so if you need to check or supplement, give us a call!
